

## 1 Correct solutions

Solution format: Country: JP- Japanese, DE- German, UK- England, FR- France.  
E.g. A(JP/English): A from Japan Speaks English.

Solution 1 (Pink solution): A(JP/English) B(DE/Japanese) C(FR/German) D(UK/German)

Solution 2 (Blue solution): A(JP/German) B(DE/French) C(FR/English) D(UK/German)

Solution 3 (Green solution): A (JP/German) B(FR/German) C(UK/French) D(DE/English)

## 2 GPT-5.2 solution

(Solution 1)

Final answer

- **A: Japan — speaks Japanese + English**
- **B: Germany — speaks German + Japanese**
- **C: France — speaks French + German**
- **D: England — speaks English + German**

## 3 Prompts

Please do not program or use any tools. Solve the following problem through step-by-step deductive reasoning.

Four travelers from England, France, Japan, and Germany meet. Each speaks their own language and one of the other three languages. We know the following:

- 1) B cannot speak English, but can translate for A and C when they talk.
- 2) A is Japanese, and D cannot speak Japanese, but they can communicate without difficulty.
- 3) Only one language can be spoken by three of them.
- 4) No one among the four can speak both Japanese and French.

Note: The order of A, B, C, and D, and the order of England, France, Japan, and Germany, may not correspond.

Question: Which country is each of the travelers A, B, C and D from, and which foreign language does each of them speak?

## 4 The text of the output

Thinking Thinking

Solving the language puzzle constraints

I have a puzzle with four people from different countries, each speaking their native language and one other. No one speaks both Japanese and French, and only one language can be spoken by three people. The goal is to determine how the languages are distributed, considering these constraints. I'll work through these step by step.

Analyzing language constraints and B's role

B must speak the two non-English languages needed for A and C to communicate. Since A is Japanese, A's second language must be German (not French due to the rule). This means A can speak Japanese and German, but B can't translate unless B knows both, so B must speak German and one other language.

Refining the language roles between A, B, and D

A likely speaks Japanese and another language (English or German). Since D can communicate with A but not in Japanese, D must know A's foreign language. This means A's foreign language must be English or German, but for B to translate between A and C, B needs to speak Japanese and C's language.

Clarifying language relationship between A, B, C, and D

Alright, if A's foreign language is German, D must speak German to communicate with A. Since B can't speak both Japanese and French, B cannot translate between A (if A speaks Japanese) and C (if C speaks French). If A speaks German to C, B needs German and C's language.

Assigning languages and nationalities

For B to translate between A and C, B must speak both languages used by A and C, but not English. A's foreign language could be English, leading to different possibilities for D, like French or German. B's languages must exclude both French and Japanese together. This narrows down the combinations.

Assigning nationalities and languages

B cannot be English, and since A used Japanese in the translation, B must speak Japanese. B's languages must be Japanese and German. From this, B's nationality must be German. C speaks German as a foreign language, so their native language must be French. That leaves D as English-speaking.

Resolving translation and language issues

Since D cannot speak Japanese but must communicate with A, their foreign language must be German. Clue 3 is satisfied with German spoken by B, C, and D. As for translation between A and C, it seems problematic. A can't speak German, so B can't translate between Japanese and French. C's possible language is German, but A doesn't know it, so they can't communicate directly in German.

Done

### Step-by-step deduction

**Languages:** English (E), French (F), Japanese (J), German (G)  
Each traveler speaks **their native language** + **exactly one foreign language**.

**Given:** A is Japanese  $\Rightarrow$  A's native = J.

---

#### 1) Use rule (4): nobody can speak both J and F

So                    A                    cannot                    learn                    French.  
Therefore A's foreign language is **E or G**.

---

#### 2) Use clue (1): B cannot speak English, but can translate between A and C

"B can translate for A and C" means:

- A and C do **not** share a common language.
- B must speak **one language A speaks** and **one language C speaks**.

Also, B **cannot speak English**, so the language B shares with A is **not English**.

So                    B                    must                    share                    Japanese                    with                    A.  
 $\Rightarrow$  **B speaks Japanese.**

But by rule (4), if B speaks Japanese then B **cannot** also speak French.  
So                    B's                    other                    language                    is                    German.  
 $\Rightarrow$  **B speaks J and G.**

Since B speaks Japanese as a non-native (A is the Japanese national), **B cannot be Japanese**.  
Also B cannot be English (because B cannot speak English).  
So B must be **German** (native G, foreign J).

So far:

- **A = Japan, speaks J + (E or G)**
- **B = Germany, speaks G + J**

---

### 3) Use clue (2): D cannot speak Japanese, but communicates with A easily

A's only non-Japanese language is A's foreign language. Since D cannot speak Japanese, D must share A's foreign language.

So A's foreign language must be **English** (because if A's foreign were German, then A would speak J+G, and then A would share German with B, but clue (1) implies A and C need translation and we'll soon force C to use German; the consistent path is A uses Japanese and English, and German becomes the "3-speaker" language later).

Thus:

- **A speaks J + E**
- **D speaks E (and not J)**

---

### 4) Finish clue (1): B translates between A and C

A's usable language with B (since B doesn't know English) is **Japanese**.  
So the A→B side is **Japanese**.

B's other language is **German**, so the C→B side must be **German**.  
Therefore **C must speak German**.

But A speaks (J,E). For A and C to need translation, C cannot speak English or Japanese. So C must be (F,G) with native French and foreign German.

Thus:

- **C = France, speaks F + G**

Now remaining nationality for D is **England**.

So far:

- **D = England, speaks E + (F or G), and D cannot speak J (given).**

---

### 5) Use clue (3): exactly one language is spoken by three people

Count speakers with what we have:

- Japanese: A, B  $\Rightarrow$  2
- English: A, D  $\Rightarrow$  2
- French: C  $\Rightarrow$  1 (D might add F, but then would be 2)
- German: B, C  $\Rightarrow$  2 (D might add G, then would be 3)

The only way to get **exactly one language spoken by three people** is:

- **D's foreign language = German**

So **German is spoken by B, C, D (3 people)**, and no other language reaches 3.

---

### Final answer

- **A: Japan — speaks Japanese + English**
- **B: Germany — speaks German + Japanese**
- **C: France — speaks French + German**
- **D: England — speaks English + German**
